

1. Started Scrolling tiktok at 20:00 and the app usage inside exposure details shows usage of 2h 47m

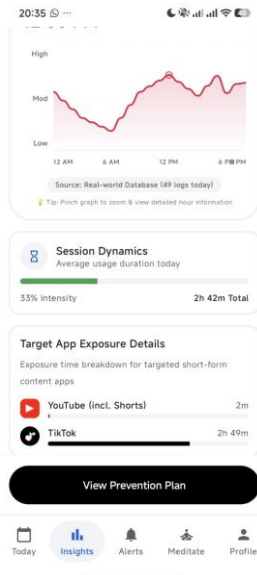

2. Then after 20 minutes of continuously scrolling tiktok the app usage inside exposure details shows usage of 2h 49m even though I scrolled for about 20 minutes and the session dynamics is also not working as supposed it is.

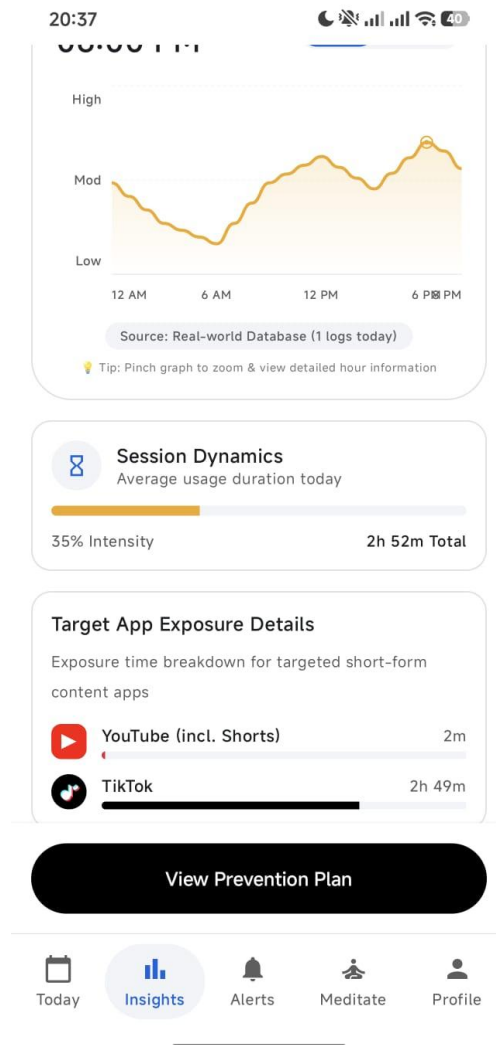

3. Closed tiktok and start scrolling YouTube (shorts) starting 20:26 and the app usage inside exposure details shows usage of 2minutes.

4. Then after 15 minutes of continuously scrolling youtube (shorts) the app usage inside exposure details shows usage of 2minutes even though I scrolled for about 15 minutes and the session dynamics is also not working as supposed it is.

5. Then I tried to delete the storage data, the reenable the accessibility permissions for the apps, the enabled the real-world sensor mode. It shows data as you can see from the image below

Bugs:

- As you can see the time indicator from x label overlapping with other numbers, the 6AM numbers supposed to be move to left side so the supposed number is not overlapping with current time numbers and so on
